

The DR® Electric/Hydraulic WOOD SPLITTER

GREAT FOR KINDLING!

The DR's perfect control makes it much easier and safer for kindling than fussing with a splitting hatchet.

VERY SOLID

and ruggedly built.

Built-in handle

for transport (just tilt it up and roll it to where you need it on its back wheels).

"Before we bought the DR Wood Splitter we hired a gas-powered machine which had to be picked up and returned. To justify the cost of renting the machine we had to employ 4 people to operate it all day and split enough logs for a whole winter. Now, with your electric splitter, we can split plenty of wood whenever we have an hour or two to spare — a great improvement! Thanks."

At last...a quiet, indoor/outdoor Electric-Powered Wood Splitter!

This powerful little splitter is a wonderful alternative to splitting mauls, axes and wedges, and gasoline-powered splitters. Just plug it in and it delivers 4 tons of hydraulic thrust.

Designed with safety in mind, there are no fast-moving parts, and you must hold both hands well away from the action in order to activate the ram.

With no exhaust or fumes, you can use the DR® Electric/Hydraulic WOOD SPLITTER indoors in your workshop, garage, or basement...or outdoors with an extension cord.

GROUND-FAULT BREAKER

protects the unit and you from overloads.

SIDE TRAYS

help hold the log while being split.

HYDRAULIC RESERVOIR

is contained within the welded steel beam, so there are no hoses to wear, get in the way, or rupture!

SPLIT LOGS

up to 10" thick and 20" long with 4 tons of pressure!

Plugs into any standard 110-volt electrical outlet.

37" long x 21-1/2" high.
Only 99 lbs.

SO QUIET

and with no exhaust fumes, you can set up shop indoors — splitting in a comfortable corner of your garage, shed, or basement — on your own schedule, rain or shine!
